BASIC-ABSTRACT:

Process for protecting ceramic products from soiling comprises coating the product with a material which prevents the ingress of soiling matter and which can readily be removed together with the soiling matter after the ceramic products have been put in place or worked.

Prefd. coating materials comprise 40-100 parts (dry wt. of a natural or synthetic latex and 0-60 parts (dry wt.) of an emulsion, dispersion or soln. of a natural or synthetic resin, cellulose prod. natural gum or animal protein.

The process specifically relates to **ceramic tiles and natural stone floor and wall-covering materials; the coating facilitates removal** of excess grouting compound, cement etc.
